

Introduction to HTML and CSS

What is HTML?

HTML stands for **Hyper Text Markup Language**. It is a language of World Wide Web (www). It is a standard text formatting language which is used to create and display pages on the Web. It makes the text more interactive and dynamic. It can turn text into images, tables, links.

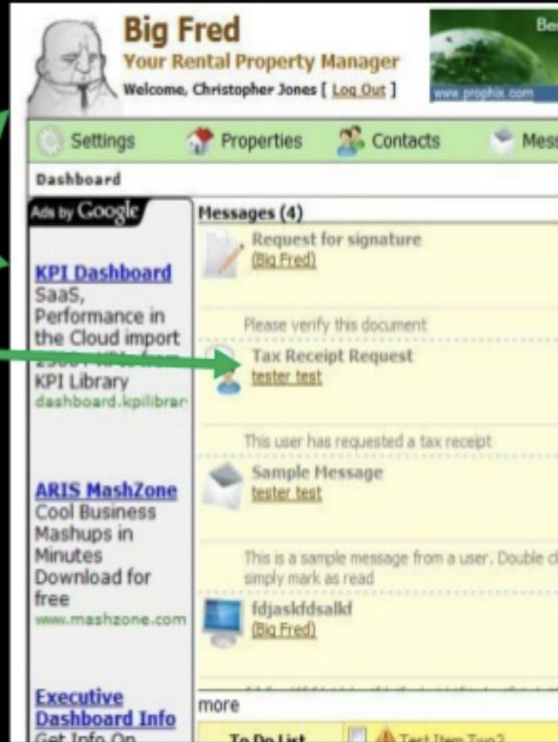

```
<!DOCTYPE html>
<html>
<body>
<h2>HTML Iframes example</h2>
<p>Use the height and width attributes to specify the size of the iframe:</p>
<iframe src="https://www.google.com/" height="300" width="400"></iframe>
</body>
</html>
```

CONCEPTS OF HTML

HTML controls:

- Layout
- Image Placement
- Links

HTML BASICS

HTML BASICS

- Elements are used to describe text
- An element is comprised of:
 - An opening tag
 - A closing tag
 - Content
- Tags are denoted by the greater and less than signs `<` `>`

Element

` The text will appear bold `

Opening Tag

Content

Closing Tag

LAYOUT ELEMENTS

- `<html>` starts your page
- `<head>` classifies your page
- `<body>` contains your visible page
- `<div>` starts a new block or section of the page
- `` is a generic wrap for a line of text
 - Used for more complex text styles
- `<h1> ... <h6>` creates heading and subheadings

SAVING IN HTML

1. Select "**Save As...**" to change the extension to `.html`. Expand the "**Save As...**" dialog to see the additional options and then manually change the file's extension to `.html`.
2. Save the document with the following format:

`filename.html`

- For example: `lab1.html`

Remember to save your document in a place that you can find it again. One way to do this is to create a folder called `yourlastname_firstwebpage` on your desktop or in your roaming hard drive.

PLANNING YOUR SITE

- Think about what divisions you will need
- Start with the highest level: the body
- Then divide up your page
- Starting with the biggest divisions, down to the smallest

CODING YOUR SITE

Note that 'id' or 'class' values cannot contain spaces

PREPARING YOUR STYLE

```
<head>

<style type="text/css">

    div {
        border: solid 1px;
    }
    #title
    {
    }

    #menu
    {
    }
```

Adds a simple thin black border around each division

This is just for clarity while editing and we will remove this after we're done

```
    #mainarea
    {
    }
    #content
    {
    }
    #footer
    {
    }
</style>

</head>
```

Notice that instead of using a period (.) we use the hash symbol (#) to reference the id name of an element

CODING YOUR SITE

What is CSS?

CSS stands for **Cascading Style Sheets**. It is a style sheet language which is used to describe the look and formatting of a document written in markup language. It provides an additional feature to HTML.

Following are the different variations of CSS:

- CSS1
- CSS2
- CSS2.1
- CSS3
- CSS4

```
<style>
```

```
body {
```

```
    background-color: linen;
```

```
}
```

```
h1 {
```

```
    color: red;
```

```
    margin-left: 80px;
```

```
}
```

```
</style>
```

PREPARING YOUR STYLE

```
<head>

<style type="text/css">

    div {
        border: solid 1px;
    }
    #title
    {
    }

    #menu
    {
    }
```

Adds a simple thin black border around each division

This is just for clarity while editing and we will remove this after we're done

```
        #mainarea
        {
        }
        #content
        {
        }
        #footer
        {
        }
    </style>
</head>
```

Notice that instead of using a period (.) we use the hash symbol (#) to reference the id name of an element

POSITIONING YOUR DIVISIONS

- By default, `<div>`s take up the entire width of this page and resize the length to fit your content
- You can force the size your `<div>` using pixels or ratios

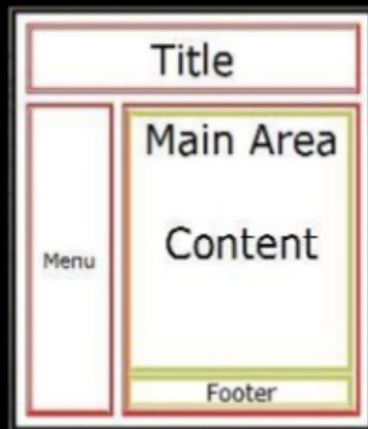

e.g. `height: 100px;`
 `width: 50%;`

- And, you can tell a division stay on one side

e.g. `float: left;`
 `float: right;`

FORMATTING YOUR DIVISIONS

```
<head>
<style type="text/css">
  div
  {
    border: solid 1px;
    margin: 5px;
    padding: 5px;
  }
  #title
  {
    height: 50px;
  }
  #menu
  {
    width: 150px;
    float: left;
    height: 400px;
  }
  #mainarea
  {
    margin-left: 180px;
    margin-top: 10px;
  }
  #content
  {
  }
  #footer
  {
    height: 30px;
    text-align: right;
  }
</style>
</head>
```

LINKS, IMAGES AND VIDEO

The cool stuff!

IMAGES

- Adding an image is easy!
- ``
- Sometimes files can be located in a sub-folder of a website
- ``
- Or on other sites
- ``

THE `ALT` AND `TITLE` TAGS

- The `alt` tag provides textual context if the image is missing
- The `title` tag provides a *tooltip* for the user when they place their cursor over it
- ```

```

# FLOATING IMAGES

- You can position images using the float style

```

```

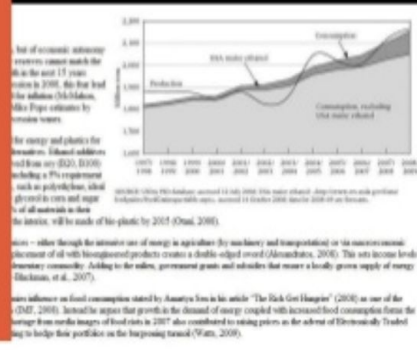

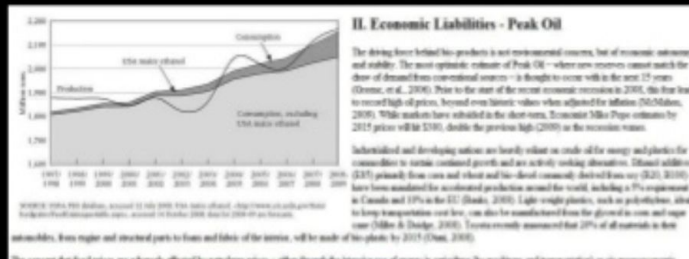

```

```

This is called an in-line style.

Use this for specific tags (like image) and for extremely individual changes.

Image is one of the only exceptions that we will allow for in-line style in the HTML.

# RESIZING IMAGES

- You can change the size of the image using the `width` and `height` tags

```

```

```

```

```

```

Normal

Small

Stretched

# BACKGROUNDS

- Background for an entire page

```
<style type="text/css">
body
{
background: url(floral.jpg);
}
</style>
```

# LINKS

- Links can be to internal, external site or jump to a section on your page via an **anchor**
- We create a link by wrapping text or an image with the `<a>` tag

`<a href="http://www.w3schools.com/">Visit W3Schools!</a>` ← external link

`<a href="mypage2.html">Page Two</a>` ← internal

# ANCHORS

- We can create anchors by creating an empty `<a>` tag and providing it with an identifier

```

```

- And link to it using the identifier with a `#` symbol

```
Jump to Anchor called name
```

# LINK STYLES

- Links have four states

```
a:link { color:#ff0000; } /* unvisited link */
a:visited { color:#00ff00; } /* visited link */
a:hover { color:#ff00ff; } /* mouse over link */
a:active { color:#0000ff; } /* selected link */
```

[http://www.w3schools.com/css/tryit.asp?filename=trycss\\_link](http://www.w3schools.com/css/tryit.asp?filename=trycss_link)

# VIDEO

There are two methods of placing video on a website using the `<iframe>` and `<video>` tags.

```
<iframe width="420" height="315"
 src="http://www.youtube.com/embed/Sqiff0FWvvs" frameborder="0"
 allowfullscreen>

</iframe>

<video width="320" height="240" controls="controls">
 <source src="movie.mp4" type="video/mp4">
</video>
```

# EXTERNAL CSS FILES

- Today, we've only put the CSS in the <head> portion of your .html file. Typically, you would have an additional file
- Extension is .CSS

Insert the following line of code into the head of each of your HTML files:

```
<link rel="stylesheet" type="text/css" href="mystyle.css">*
```

*\*This assumes that the file is called "mystyle.css"*
